Fix rate weight capped at 10 items

TICKET	RELEASE	DATE	TYPE
#387721	v1.0.32p	May 08, 2026	Support Guide

Feature Summary

Earlier, orders with 10+ different products could use the wrong total weight in AU Post rate requests. That meant checkout rates and related shipping calculations could be based on a lower weight than the actual order. With this fix, the full order weight is now included in the calculation so rates and label-related weight values use the correct total weight.

Release Details

- Patch: urgent fix in v1.0.32p.
- Ticket: #387721 for nungartradingco.myshopify.com.
- Issue: orders with 10+ different products could be underweighted, which could undercharge shipping.
- Fix: the total weight now uses the full order weight instead of stopping at 10 items.

Where to Find This in the App

- Checkout rate calculation for orders with 10+ different products.
- AU Post app label flow when reviewing shipment weight for larger mixed-product orders.
- Rate logs or shipment request JSON when validating weight for orders with 10+ different products.

Step-by-Step Walkthrough

1. Create or identify an order with 10+ different products.
2. Use known product weights so the expected total is easy to verify.
3. Check the returned rate or the request log and confirm the total weight uses the full order weight.
4. For the regression example, confirm the final sent weight matches the full combined order weight instead of stopping at 10 items.

Expected Behaviour — What Support Should Observe

- Orders with 10+ different products should use the full order weight when calculating rates.
- Checkout rates should reflect the true total shipment weight instead of a capped value.
- Label-related weight values should stay aligned with the full combined order weight.
