

Feature: AI-032 — Signature + Date and QTY × SKU on AU Post Labels [#394693]

Release: SL AuPost v1.0.37

Date: 2026-07-23

Trello: <https://trello.com/c/06hQ2JhH>

Developed by: athiramohan (card member — confirm role)

Tested by: arshiya

Account Type(s): eParcel (SKU with Quantity is eParcel-only; sender name + date applies to all non-return shipments)

QA Status: QA_VERIFIED

Feature Summary

This release adds two label enhancements:

1. Product SKU with Quantity on the label (customer_reference_2).

A new reference option, "**Product SKU with Quantity (e.g. 2X,1G)**", can be selected in Settings so labels print each product's SKU prefixed by its quantity. This is gated behind a per-shop feature toggle and is only available for eParcel accounts.

2. Sender Name + Date in the label signature section.

The app now sends `international_parcel_sender_name` on every item for all non-return shipments (domestic + international). Australia Post uses this field to print the sender name and the label creation date in the signature section — visible on international CN22/CN23 customs documents. No setup is required; it works automatically.

Account Type Coverage

- **eParcel:** Both features apply. SKU with Quantity option appears in Settings when the toggle is enabled; sender name + date prints on international CN22/CN23 documents.
- **MyPost Business:** The **Product SKU with Quantity option is NOT available** for MyPost Business accounts. MyPost Business is domestic-only, and QA observed the signature/date is not printed on domestic labels, so no merchant-visible change.
- **StarTrack:** The SKU with Quantity option is NOT available for StarTrack accounts.

Toggles & Prerequisites

Feature 1 — Product SKU with Quantity (toggle required, PluginHive internal):

1. Add "`<shopname>.myshopify.com.sku.with.quantity.on.label.enabled`": `true` to `featureToggles.json` (requires a dev/ops change — support cannot do this from the app UI).
2. In the app: Settings → Labels section → enable "**Show References On Labels**".
3. A new dropdown option "**Product SKU with Quantity (e.g. 2X,1G)**" appears — select it and Save.

Toggle OFF behaviour: the dropdown option disappears; the select falls back to **Product Names**; labels print Product Names. The saved DB value is preserved — re-enabling the toggle restores the merchant's previous selection.

Feature 2 — Sender Name + Date: No toggle required — available automatically for all non-return shipments.

The printed name comes from the ship-from address **person name**, falling back to the **company name** when no person name is set.

Where to Find This in the App

- Reference option: AU Post app sidebar → **Settings** (/apps/au-post-qa/setting) → Documents/Labels section → **"Show References On Labels"** → reference dropdown
- Label generation: Shopify admin → **Orders** → click order → **More Actions** → **"AU Post Generate Label"**
- Verification JSON: Order Summary → **More Actions** → **Download Documents** (ZIP with label PDF + request/response JSON)

Step-by-Step Walkthrough (Support / Demo)

Scenario A — SKU with Quantity on the label (eParcel)

1. Confirm the shop's feature toggle is enabled in featureToggles.json (internal).
2. AU Post app sidebar → **Settings** (/apps/au-post-qa/setting) → Documents/Labels section.
3. Enable **"Show References On Labels"**, select **"Product SKU with Quantity (e.g. 2X,1G)"**, Save.
4. Shopify admin → **Orders** → click an order row → **More Actions** → **"AU Post Generate Label"**.
5. In the app label page: **"Generate Packages"** → **"Get Shipping Rates"** → select a rate radio → **"Generate Label"**.
6. On the Order Summary page: **More Actions** → **Download Documents** → open the createShipment request JSON.
7. Verify customer_reference_2 follows the format, e.g. 3 ABC, DEFGHIJ, 2 XYZ, -.

Scenario B — Sender Name + Date on CN22/CN23 (international, eParcel)

1. Generate a label for an **international** order (same manual flow as above).
2. Order Summary → **More Actions** → **Download Documents**.
3. In the request JSON verify items[0].international_parcel_sender_name = ship-from person name (or company name when no person name is set).
4. Open the label PDF → the CN22/CN23 signature section shows the **sender name + label creation date**.
5. Generate a **return label** (Order Summary → "Return packages" tab → "Return Packages" → "Refresh Rates" → "Generate Return Label") → verify international_parcel_sender_name is **not** sent for return labels.

Expected Behaviour — What Support Should Observe

SKU with Quantity string rules (customer_reference_2):

- Each SKU trimmed to **10 characters**
- Quantity > 1 → prefixed with quantity + space: 3 MYSKU
- Quantity = 1 → no prefix: MYSKU
- Product without SKU → -
- All items comma-separated; whole string capped at **50 characters** (AU Post API limit)
- Example: 3 ABC, DEFGHIJ, 2 XYZ, -

Sender name + date:

- international_parcel_sender_name present on every item for non-return shipments
- Printed date matches the label generation date
- Field skipped on return labels
- Existing customs information (values, descriptions) unchanged

Toggle interplay: turning the toggle off after a merchant saved "SKU with Quantity" → labels print Product Names (server fallback); re-enabling restores the saved selection.
