Sample Label Generation Fails with HTTP 400

TICKET	RELEASE	DATE	TYPE
#333261	SL AuPost v1.0.32	May 06, 2026	Support Guide

SUPPORT GUIDE

From SL: AI-017 — Sample Label Generation Fails with HTTP 400

Feature Summary

generate() overrides merchant credentials with hardcoded PluginHive test account data — but config.accountMap["My_Post_Express"] stores a UUID-style OAuth token, not a numeric account number. MyPost API account-number header expects a numeric value → HTTP 400.

Release Details

- Status: ■ IN PROGRESS — Branch: bugfix/sample-label-generation-for-live-accounts (d17091f pending merge, does NOT fix root cause)
- Risk: ■■ High — label generation path; shared config.json change affects all merchants
- Confidence from analysis: HIGH
- Root cause: generate() overrides merchant credentials with hardcoded PluginHive test account data — but config.accountMap["My_Post_Express"] stores a UUID-style OAuth token, not a numeric account number
- Fix direction: Fix config maps for MyPost services (correct account number format + add missing password entries + add chargeAccountNumber for CHARGE_TO_ACCOUNT payment flow)

Where to Find This in the App

- Navigate Home -> App Guide -> Label Generation Guide.
- Select the carrier account to test, then use Generate Label from that guide flow.
- Use a MyPost or eParcel test account with valid credentials before retrying.

Step-by-Step Walkthrough

1. Confirm the store and account setup referenced in the Trello card.
2. Navigate to the affected AU Post app area.
3. Repeat the QA scenario captured on the card.
4. Compare the observed result against the expected fixed behaviour.

Expected Behaviour — What Support Should Observe

- The issue should reproduce on older logic and stop reproducing after the release fix.
- Support should see the outcome described in the approved QA scenario.
- If the old behaviour remains, capture store, order, and timing details before escalation.

Common Questions & Troubleshooting

Q: What should support check first?

A: Confirm the store is on the intended release and the scenario matches the card prerequisites.

Q: When should this be escalated?

A: Escalate if the old behaviour is still visible after prerequisites are met and the release is confirmed.

Q: What evidence helps most?

A: Collect the merchant store, exact steps taken, screenshots, and any order or request identifiers.

AI-016

No Unmanifested Orders Tab — Can't Bulk-View Unlodged Labels

TICKET	RELEASE	DATE	TYPE
#276220	SL AuPost v1.0.32	May 06, 2026	Support Guide

SUPPORT GUIDE

From SL: AI-016 — No Unmanifested Orders Tab — Can't Bulk-View Unlodged Labels

Feature Summary

A simpler order view is being added so support and merchants can quickly identify orders that already have labels generated but are still waiting to be manifested.

Release Details

- Status: ■ READY FOR DEV — no branch exists; PR #396 (add-order-filters, merged Apr 13 2026) is a prerequisite foundation but does not implement this feature
- Purpose: make it easier to find label-generated orders that still need manifesting.
- Support impact: reduces the effort needed to review unlodged shipments in bulk.

Where to Find This in the App

- Open Shipping in the AU Post app.
- Go to the Label Generated area to review orders that are manifest pending.

Step-by-Step Walkthrough

1. Open Shipping in the AU Post app.
2. Go to the Label Generated view.
3. Review orders that already have labels but are still waiting for manifest.
4. Use that view to confirm which orders are ready for the next manifest action.

Expected Behaviour — What Support Should Observe

- Label-generated orders that are still manifest pending should be easy to identify in one place.
- Support should be able to review these orders without manually checking each shipment one by one.
- The view should help separate already-manifested orders from ones still waiting for manifest.

Common Questions & Troubleshooting

Q: What should support look for first?

A: Confirm the order already has a generated label and then check whether it is still waiting for manifest.

Q: Why would a merchant use this view?

A: It helps them quickly find shipments that are ready for the next manifest step.

Q: When should this be escalated?

A: Escalate if label-generated orders are missing from the view or if already-manifested orders are mixed into the pending list.

CARD

AI-011

Pre-Defined AU Post Boxes Deleted — No Restore Option

TICKET	RELEASE	DATE	TYPE
#384943	SL AuPost v1.0.32	May 06, 2026	Support Guide

SUPPORT GUIDE

From SL: AI-011 — Pre-Defined AU Post Boxes Deleted — No Restore Option

Feature Summary

A Restore AU Post Defaults button is added in Box Packaging Settings. When this button is clicked, all AU Post boxes are restored.

Release Details

- Status: ■ READY FOR DEV — endpoint exists but is silently broken; no fix branch found
- Purpose: make it easy to bring back deleted AU Post default boxes.
- Support impact: gives merchants a quick recovery option in packaging settings.

Where to Find This in the App

- Open Settings in the AU Post app.
- Go to Box Packaging Settings.
- Look for the Restore AU Post Defaults button.

Step-by-Step Walkthrough

1. Open Settings in the AU Post app.
2. Go to Box Packaging Settings.
3. Click the Restore AU Post Defaults button.
4. Confirm that the AU Post boxes appear again in the packaging list.

Expected Behaviour — What Support Should Observe

- Clicking Restore AU Post Defaults should restore all AU Post boxes.
- Merchants should be able to see the restored AU Post boxes again in packaging settings.
- This should make it easier to recover default boxes without manual re-entry.

Common Questions & Troubleshooting

Q: Where can support find this option?

A: In Box Packaging Settings inside the AU Post app.

Q: What should happen after clicking the button?

A: The AU Post default boxes should be restored and shown again in the packaging list.

Q: When should this be escalated?

A: Escalate if the button is missing or if the AU Post boxes do not return after using it.

AI-003

Weight Field Greyed Out and Non-Editable on Product

TICKET	RELEASE	DATE	TYPE
#383737	SL AuPost v1.0.32	May 06, 2026	Support Guide

SUPPORT GUIDE

From SL: AI-003 — Weight Field Greyed Out and Non-Editable on Product

Feature Summary

Earlier, the product weight was fully controlled by Shopify, so the field was greyed out and any updates made in the app could get overwritten. If Shopify sent a weight of 0, it could also lead to label failures. With the latest fix, the system now correctly uses a valid weight from the synced Shopify value, a configured default weight, or a manually overridden value.

Release Details

- Status: ■ READY FOR DEV — no fix branch found; webhook-only weight sync is by design but AC requires manual override path
- Purpose: prevent label failures caused by missing, zero, or overwritten product weight.
- Support impact: ensures the system can use a valid weight even when the Shopify value is not usable.

Where to Find This in the App

- Open Products in the AU Post app.
- Search for the product and open its product settings page.
- Review the product weight shown in the app and compare it with the Shopify product weight if needed.

Step-by-Step Walkthrough

1. Open the product in Shopify and check the product or variant weight there first.
2. Open the same product in the AU Post app.
3. Confirm whether the Shopify weight is valid, missing, or set to 0.
4. Verify that label generation now uses a valid weight from the synced Shopify weight, a configured default weight, or a manual override.

Expected Behaviour — What Support Should Observe

- The system should no longer rely only on an unusable Shopify weight when generating labels.
- If Shopify sends a missing or 0 weight, the system should use a valid default or overridden weight where available.
- Label generation should work properly even when the original Shopify weight is missing or 0.

Common Questions & Troubleshooting

Q: Why is the weight field greyed out?

A: Because Shopify still controls the main synced product weight shown in the app.

Q: What changed with this fix?

A: The system can now use the synced Shopify weight, a configured default weight, or a manually overridden value to keep label generation working.

Q: What should support check if a merchant still reports weight-related label issues?

A: Check the Shopify weight first, then confirm whether a valid default or overridden weight is available for the product.

CARD

C-07

TLS 1.2+ Compliance — All AU Post API Calls

TICKET	RELEASE	DATE	TYPE
#382780, #383002	SL AuPost v1.0.32	May 06, 2026	Support Guide

SUPPORT GUIDE

From SL: C-07 — TLS 1.2+ Compliance — All AU Post API Calls

Feature Summary

Both carrier API clients use bare axios(options) with no httpsAgent — TLS version negotiation left to Node.js runtime defaults. package.json requires Node >= 8.1.0; Node 8 defaults to TLS 1.0 minimum. No minVersion: 'TLSv1.2' enforced anywhere.

Release Details

- Status: ■ READY FOR DEV — no fix branch or TLS-related commit found; hard deadline 2026-07-07 (63 days)
- Risk: ■■ Medium — touches all outbound AU Post API calls; must smoke-test rates + labels in staging before prod
- Confidence from analysis: HIGH
- Root cause: Both carrier API clients use bare axios(options) with no httpsAgent — TLS version negotiation left to Node.js runtime defaults. package.json requires Node >= 8.1.0; Node 8 defaults
- Fix direction: Inject https.Agent({ minVersion: 'TLSv1.2' }) into both carrier axios call sites, or enforce globally at startup

Where to Find This in the App

- This is a backend reliability change with no direct UI switch.
- Verify the change through rate, label, tracking, and validation flows.

Step-by-Step Walkthrough

1. Confirm the store and account setup referenced in the Trello card.
2. Navigate to the affected AU Post app area.
3. Repeat the QA scenario captured on the card.
4. Compare the observed result against the expected fixed behaviour.

Expected Behaviour — What Support Should Observe

- The issue should reproduce on older logic and stop reproducing after the release fix.
- Support should see the outcome described in the approved QA scenario.
- If the old behaviour remains, capture store, order, and timing details before escalation.

Common Questions & Troubleshooting

Q: What should support check first?

A: Confirm the store is on the intended release and the scenario matches the card prerequisites.

Q: When should this be escalated?

A: Escalate if the old behaviour is still visible after prerequisites are met and the release is confirmed.

Q: What evidence helps most?

A: Collect the merchant store, exact steps taken, screenshots, and any order or request identifiers.

CARD

C-10

CCS Not Enabled — In-App Detection Banner

TICKET	RELEASE	DATE	TYPE
-	SL AuPost v1.0.32	May 06, 2026	Support Guide

SUPPORT GUIDE

From SL: C-10 — CCS Not Enabled — In-App Detection Banner

Feature Summary

isCarrierServicesApiEnabled already exists in Shop model and is set during install-time CCR registration. Two existing server endpoints (GET /shop/ccr-unsupported-plan, GET /shop/ccr-failure) surface CCS messaging, but only as separate pages/redirects — not as an in-app persistent banner on home page load. No 1-hour TTL cache layer exists.

Release Details

- Status: ■ READY FOR DEV — server-side CCS status is tracked but no client banner exists; partial server infra reusable
- Risk: ■■ Medium — new server endpoint + cache layer + client component; no regression risk to existing CCR flow
- Confidence from analysis: MEDIUM
- Root cause: isCarrierServicesApiEnabled already exists in Shop model and is set during install-time CCR registration. Two existing server endpoints (GET /shop/ccr-unsupported-plan, GET /shop/c
- Fix direction: New GET /api/v1/shop/ccs-status endpoint with 1h TTL; client Polaris Banner on home page calling it on load

Where to Find This in the App

- Open the AU Post app home page or dashboard after store load.
- Look for the carrier-calculated-shipping banner state.

Step-by-Step Walkthrough

1. Confirm the store and account setup referenced in the Trello card.
2. Navigate to the affected AU Post app area.
3. Repeat the QA scenario captured on the card.
4. Compare the observed result against the expected fixed behaviour.

Expected Behaviour — What Support Should Observe

- The issue should reproduce on older logic and stop reproducing after the release fix.
- Support should see the outcome described in the approved QA scenario.
- If the old behaviour remains, capture store, order, and timing details before escalation.

Common Questions & Troubleshooting

Q: What should support check first?

A: Confirm the store is on the intended release and the scenario matches the card prerequisites.

Q: When should this be escalated?

A: Escalate if the old behaviour is still visible after prerequisites are met and the release is confirmed.

Q: What evidence helps most?

A: Collect the merchant store, exact steps taken, screenshots, and any order or request identifiers.
