Suburb normalisation not applied to label generation address

TICKET	RELEASE	DATE	TYPE
-	SL AuPost v1.0.33	May 20, 2026	Support Guide

SUPPORT GUIDE

From SL: AI-020 — Suburb normalisation not applied to label generation address

Feature Summary

Suburb normalisation is now applied consistently during label generation. Previously, the label generation path bypassed address validation, causing AU Post to reject non-canonical suburb names like 'Saint Clair'. The fix ensures both rate calculation and label generation call `validateAddress()` to normalise suburbs before sending requests to AU Post, improving label success rates for variant suburb spellings.

Where to Find This in the App

- Order detail page → Generate Label button triggers the updated label generation flow
- Server logs show `validateAddress()` call and corrected suburb value in AU Post request payload
- Settings → Australia Post carrier configuration remains unchanged

Step-by-Step Walkthrough

1. Create a test order with shipping suburb 'Saint Clair' (non-canonical form)
2. Navigate to the order detail page in the AU Post app
3. Click Generate Label — the app now calls `validateAddress()` to normalise the suburb
4. Verify the label generates successfully and the corrected suburb appears in server logs
5. Confirm rate calculation for the same order still works without regression

Expected Behaviour — What Support Should Observe

- Labels generate successfully for variant suburb spellings (Saint Clair, Mount Waverley, etc.)
- Corrected suburb value is sent to AU Post label API, matching the suburb used in rate requests
- Standard suburbs (Bondi, Surry Hills) continue to work without unnecessary transformations
- International addresses skip validation and label generation is unaffected
- Invalid suburbs with no valid match display a clear error and block label generation

Common Questions & Troubleshooting

Q: Label generation fails with 'address validation error' for a valid suburb.

A: Check server logs for `validateAddress()` response. If the suburb has no match in AU Post's database, `findBestSuburbMatch()` returns null and blocks generation. Verify the suburb spelling against AU Post's canonical list or contact support with the suburb name.

Q: Label generation hangs or times out during address validation.

A: The `validateAddress()` call now includes timeout/retry logic from the rates path. If timeouts persist, check AU Post API status and network connectivity. If the issue continues, retry the label generation after a few minutes.

Q: Rate calculation and label generation use different suburb values for the same order.

A: Both paths now call `validateAddress()` and apply the same `bestMatch` logic. If discrepancies appear, check server logs to confirm `validateAddress()` is being called in both flows. Clear browser cache and retry. If the issue persists, contact support with the order ID and suburb name.

AI-018

Rate fetch fails for orders with special characters in address

TICKET	RELEASE	DATE	TYPE
#386695	SL AuPost v1.0.33	May 20, 2026	Support Guide

SUPPORT GUIDE

From SL: AI-018 — Rate fetch fails for orders with special characters in address

Feature Summary

Fixes rate fetch failures for orders shipping to suburbs with apostrophes and special characters (e.g., D'Aguilar, O'Connor). The app now URL-encodes address fields in validation requests and sanitizes suburb values before sending rate requests to AU Post and MyPost Business APIs. Valid addresses without special characters remain unaffected.

Where to Find This in the App

- Settings > Rate Settings > Carrier Services — verify AU Post and MyPost Business credentials
- Order detail page — trigger rate fetch for any order with apostrophe suburb
- Rate selection panel — available shipping methods display after successful fetch

Step-by-Step Walkthrough

1. Create or open a test order shipping to D'Aguilar, QLD 4104 or similar apostrophe suburb
2. Navigate to the order detail page in the PH AU Post app
3. Trigger the rate fetch action (e.g., click Fetch Rates or equivalent button)
4. Verify the address validation request URL contains encoded suburb (suburb=D%27Aguilar)
5. Confirm rate quotes are returned and displayed in the rate selection panel without errors

Expected Behaviour — What Support Should Observe

- Rate fetch succeeds for suburbs with apostrophes without manual address correction
- Address validation URL contains URL-encoded special characters (%27 for apostrophe)
- Standard suburbs (Bondi, St Kilda, Mount Waverley) continue to work as before
- MyPost Business rate requests also handle apostrophe suburbs correctly
- Error messages for genuinely invalid suburbs remain clear and distinct from encoding issues

Common Questions & Troubleshooting

Q: Rate fetch still fails for D'Aguilar or similar apostrophe suburbs

A: Verify AU Post API credentials in Settings > Rate Settings > Carrier Services are valid and active. Check app logs for malformed URL errors. If issue persists, contact support with order number and suburb name.

Q: Rate fetch for standard suburbs (no special chars) is now slower or broken

A: Encoding and sanitization are additive and do not affect standard suburbs. Clear app cache and refresh the order page. If performance degrades, check network latency to AU Post API and verify no rate limits are triggered.

Q: Label generation for apostrophe suburb orders still requires manual address edit

A: Label generation uses a separate server-side path. Ensure server branch with RemoveSpecialCharacter sanitizer in localConfig.json is deployed. If label still fails, edit the address in the order to remove or replace the apostrophe, then regenerate the label.

AI-019

International transit time not displayed at checkout

TICKET	RELEASE	DATE	TYPE
#384874	SL AuPost v1.0.33	May 20, 2026	Support Guide

SUPPORT GUIDE

From SL: AI-019 — International transit time not displayed at checkout

Feature Summary

International shipments now display estimated delivery times at checkout. The app calls AU Post's Calculate Estimated Time API after fetching international rates and merges transit times into each service option. If the ETA API is unavailable, rates still display without blocking checkout. Domestic shipments remain unaffected and continue using existing delivery estimates.

Where to Find This in the App

- Settings > Apps and integrations > PluginHive Australia Post > Configuration — verify AU Post API credentials are active
- Checkout page — international destination addresses now show 'Estimated Delivery: N Days' for each service
- Logs (admin or monitoring tool) — watch for 'Calculate ETA API' warnings if ETA calls fail

Step-by-Step Walkthrough

1. Add a product to cart and proceed to checkout with a non-Australia destination address
2. Observe shipping rate options load; each international service should display 'Estimated Delivery: X-Y Days'
3. Select an international service and verify the ETA text appears in the rate description
4. If ETA is missing or shows 'Not Available', check app logs for Calculate ETA API errors; rates should still be selectable

Expected Behaviour — What Support Should Observe

- International checkout displays transit time for each service (e.g., 'International Express Post — Estimated Delivery: 3-5 Days')
- Domestic checkout unchanged; delivery estimates come from Get Shipment Price API as before
- If Calculate ETA API times out or fails, rates still display without error; ETA text omitted for affected services
- No visible latency increase on domestic rate fetches; international rates may take 1–2 seconds longer due to parallel ETA calls

Common Questions & Troubleshooting

Q: International rates show 'Estimated Delivery: Not Available' instead of days.

A: Check app logs for 'Calculate ETA API' errors. Verify AU Post API credentials are valid and Calculate ETA endpoint is accessible. If ETA API is down, rates will still display; this is expected graceful degradation. Contact AU Post support if the API is unavailable.

Q: Checkout is slow when selecting international destinations.

A: The app now makes parallel ETA API calls per service. If latency exceeds 3 seconds, the ETA call times out and rates display without transit time. Check network latency to AU Post API and consider enabling the feature toggle `international.eta.enabled: false` to disable ETA calls temporarily.

Q: Domestic shipping rates are missing or delayed after this release.

A: Domestic rates should not be affected. Verify AU Post API credentials and check logs for 'Get Shipment Price API' errors. If domestic rates fail, the issue is not related to the international ETA feature. Restart the app or contact support.

AI-021

Display rates request/response on SLGP for L3 debugging

TICKET	RELEASE	DATE	TYPE
#386695	SL AuPost v1.0.33	May 20, 2026	Support Guide

SUPPORT GUIDE

From SL: AI-021 — Display rates request/response on SLGP for L3 debugging

Feature Summary

The original SLGP or customer-account frontend rate-log view is no longer applicable because that frontend implementation has been removed. Rate logs are no longer shown in SLGP or in the customer-facing frontend view. The supported location for this information is now the dedicated Rates Log section, where new entries appear after the merchant fetches rates or refreshes rates.

Where to Find This in the App

- Open the Rates Log section in the AU Post app.
- Use a flow that fetches rates or refreshes rates to create a new log entry.
- Review the latest request and response details from that Rates Log area.

Step-by-Step Walkthrough

1. Open the AU Post app and go to the Rates Log section.
2. Run a flow that fetches rates or refreshes rates.
3. Return to Rates Log and look for the newly created log entry.
4. Open the entry and review the request and response details there.

Expected Behaviour — What Support Should Observe

- Rate log should not be expected in the original SLGP view.
- Rate log should not be expected in the customer account frontend view.
- A new log entry should appear in Rates Log after fetching or refreshing rates.
- Support should use Rates Log as the single supported place to inspect rate request and response details.

Common Questions & Troubleshooting

Q: Why is the rate log missing from SLGP?

A: That frontend implementation has been removed, so SLGP is no longer the supported place for rate logs.

Q: Where should support check rate request and response details now?

A: Use the Rates Log section in the AU Post app.

Q: When should a new rate log entry appear?

A: After the merchant fetches rates or refreshes rates.

C-12

Express Labels Generated as Standard Post

TICKET	RELEASE	DATE	TYPE
-	SL AuPost v1.0.33	May 20, 2026	Support Guide

SUPPORT GUIDE

From SL: C-12 — Express Labels Generated as Standard Post

Feature Summary

Fixes a critical bug where Express Post orders were silently generated as Standard Post labels, causing underpaid-postage surcharges. The root cause is that the MongoDB schema defaults useCustomerSelection to false and ratesSelectionStrategy to undefined, preventing checkout service selection from being applied. The fix updates schema defaults to true and 'CHEAPEST_RATE', guards against empty service codes, and includes a data migration for existing stores.

Where to Find This in the App

- Settings > Rate Settings > Carrier Services — verify useCustomerSelection is enabled and ratesSelectionStrategy is set
- Orders > select any order > Generate Label — label will now use the service customer selected at checkout
- Orders > select multiple orders > Bulk Generate Labels — each order receives its own checkout service

Step-by-Step Walkthrough

1. Place a test order in Shopify and select Express Post as the shipping method at checkout
2. Log into the PluginHive AU Post app and navigate to the order
3. Click 'Generate Label' and wait for completion
4. Verify the generated label contains the Express Post service code (not Standard Post) and check AU Post portal to confirm correct rate was charged

Expected Behaviour — What Support Should Observe

- Express Post orders generate labels with Express service code; Standard Post orders generate labels with Standard service code
- Bulk label generation preserves each order's own checkout service selection across mixed Standard and Express orders
- Fresh installs default to useCustomerSelection=true and ratesSelectionStrategy='CHEAPEST_RATE' automatically
- No empty service codes are written to the database; if strategy is undefined, a valid fallback service is used with a warning log
- Existing stores with faulty defaults are corrected by the data migration script before deployment

Common Questions & Troubleshooting

Q: Why are Express orders still generating as Standard Post after the fix?

A: Verify the data migration script was run on your database before deployment. Check Settings > Rate Settings to confirm useCustomerSelection is true and ratesSelectionStrategy is 'CHEAPEST_RATE'. If values are still false/undefined, the migration did not complete; contact support with your store ID.

Q: Will this fix break my intentional non-customer-selection configuration?

A: No. If you have explicitly set useCustomerSelection=false with a specific strategy, that configuration remains valid and will not be overwritten. The fix only corrects stores using the faulty schema defaults. Your configured behaviour is preserved.

Q: How do I know if my store was affected by the original bug?

A: Check your server logs for empty serviceTypeSelected values during label generation, or review AU Post portal charges for Standard Post surcharges on orders where customers selected Express. The data migration will automatically correct affected stores; no manual action is required.

C-11

■ C-11 · Conflicting AU Post App — Detection Warning

TICKET	RELEASE	DATE	TYPE
-	SL AuPost v1.0.33	May 20, 2026	Support Guide

SUPPORT GUIDE

From SL: C-11 — ■ C-11 · Conflicting AU Post App — Detection Warning

Feature Summary

Detects when competing Australia Post carrier apps are active in the same Shopify store and displays a warning banner to merchants. The app queries the Shopify `carrier_services.json` API to identify active services with callback URLs that differ from ours, then shows an in-app warning banner following the C-10 design pattern with a link to Shopify shipping settings. This prevents merchant confusion from duplicate rates at checkout.

Where to Find This in the App

- Settings page — warning banner appears at top of page when conflict detected
- All app pages — `CarrierConflictBanner` component mounted globally on `PhivePage`
- Shopify shipping settings — accessible via 'Go to Shopify Shipping Settings' link in banner

Step-by-Step Walkthrough

1. Install a second Australia Post carrier app in the Shopify store alongside PluginHive AU Post app
2. Log into PluginHive AU Post app and navigate to Settings page
3. App calls `GET /shop/carrier-conflicts` endpoint to check for competing services
4. Warning banner displays with message about duplicate rates and link to Shopify shipping settings
5. Click banner link to open Shopify shipping settings and manage active carrier services

Expected Behaviour — What Support Should Observe

- Banner appears only when another active AU Post carrier service is detected with a different callback URL
- Banner does not appear when only PluginHive AU Post service is active in the store
- Our own carrier service is excluded from conflict detection by matching callback URL against `process.env.serverAddress`
- Non-AU Post carrier apps (FedEx, DHL, UPS) do not trigger false conflict warnings
- Conflict detection does not block rate generation or label creation workflows

Common Questions & Troubleshooting

Q: Why is the conflict banner showing when I only have one AU Post app installed?

A: Check Shopify shipping settings to confirm only one AU Post carrier service is active. The banner may persist briefly after uninstalling a competing app; reload the app to refresh the conflict check.

Q: The banner is not appearing even though I have two AU Post apps installed.

A: Verify both AU Post apps have active carrier services in Shopify shipping zones (not just installed). Confirm the `read_shipping` scope is granted to PluginHive AU Post app. Reload the app to trigger the conflict check endpoint.

Q: Can I dismiss the conflict banner permanently?

A: The banner dismisses for the current session only. It reappears on next app load if the conflict still exists. To permanently remove it, deactivate or uninstall the competing AU Post app from Shopify shipping settings.
